

# Project Homework 1: User Stories

The goal of this homework is to establish an initial collection of user stories to get your team going on the project, and to exercise your requirements gathering and specification skills.

## Instructions

Each person on your team must write at minimum 5 user stories that document functional requirements expressed by your customer. The USs must adhere to the following constraints:

- The USs must follow title and description templates from lecture (recall “who/what/why” – and don’t skip the why).
- No duplicate USs. (Because you’re supposed to be developing a project here, and having duplicate USs would just be dumb.)
- Include the university username of the US’s author in its title. For example, a title might be “Book Flights (sdflming)”. By including such usernames, I’ll be able to tell who contributed what.

## Submitting

To submit, add your USs to your team’s collection in Seedpod. Use “placeholder” values for each US’s priority and estimate. You’ll figure out “real” values later.

While you’re at it, make sure that your first/last name is set properly in your Seedpod profile.

## Grading

The main grading criteria will be as follows:

- Did you create at least 5 USs?
- Did you apply the template effectively?
- Are your USs clear and understandable?
- Are your USs free of typos and other sloppiness?
- Do your team’s USs do a good job of covering the system’s main business value and/or aspects of the system that might pose a significant risk?
