

Beta Milestone Instructions (Same as Alpha)

How to submit

1. For your team's code, you must tag your **trunk** as **betaMilestone**. Here are some requirements:
 - Make sure that you include a **README.txt** file in the top-level directory that contains instructions on how run/test your project.
 - For purposes of grading, we will want to run the parts of your program that you completed in the Beta Iteration. Thus, it must be clear what these parts are. You may want to add tags in the HTML to indicate which things to test and which things to stay away from.
 - There will be a deduction if your project does not run as expected. Therefore, merge your code with care, and be sure to do some system testing before you tag. (Code that is not part of your Beta Iteration work is exempt from this rule.)
 - Fix all compiler errors. If the compiler errors are in code unrelated to your work this iteration, do the bare minimum to fix the errors (e.g., comment out faulty code). If you think you have a good reason for leaving compiler errors in, let me know ASAP.
2. Also, make sure that your team's planning spreadsheet is up to date.
